

Fast and Easy Solution for Short-Term Trading

Trade | Procurement | Power | Gas

Short-term trading on the **day-ahead, intraday, and flexibility markets** is becoming more and more dynamic and volatile. For energy traders, it is essential to handle trading processes quickly and efficiently and to keep track of the large number of offers. Automated process-oriented software supports traders in their tasks and makes trading not only **easier** but also **more cost-effective**.

BelVis+ Short Term Cockpit: one tool for all markets

BelVis+ Short Term Cockpit is the new automated and convenient all-in-one solution for short-term trading. It combines the **various markets in a single tool** and handles day-ahead and intraday trading as easily and automatically as possible – of course under your full control.

The BelVis+ Short Term Cockpit efficiently supports tasks such as:

- Intraday trading for hourly and 15-minute products
- Day-ahead trading (management of the auctions DA, IDA1, IDA2, IDA3)
- Import of balancing energy deals from 3rd-party systems

- Automatic portfolio management and balancing of forecast changes, e.g., for direct marketers or transmission system operators
- Replacement procurement in the event of power plant outages

Focus on automation

During the design of the BelVis+ Short Term Cockpit, great emphasis was placed on the **highest possible level of automation** regarding bid submission, transfer of trading results and contract management in the PFM systems. The tool interacts directly with the exchanges (via APIs) and can be integrated with algo trader solutions (e.g.,

PowerBot). Closed deals are automatically processed and transferred to the portfolio management systems (by KISTERS or third parties).

Features

As an all-in-one solution for short-term trading, the BelVis+ Short Term Cockpit provides the following features:

Day-ahead and intraday auction

- Handling of hourly, 15-minute and block bids on exchanges and service providers
- Multiple accounts/clients
- Aggregation of quantities to a bid, including pre-netting

Position view for the next tradable hours

BelVis+ Short Term Cockpit

- Exchange API for directly submitting bids and receiving quantities and prices without intermediate steps
- Redistribution of quantities after import of results, including automatic management of day-ahead deals in portfolio management

Continuous intraday trading

- Display of freely definable positions for the next trading hours
- Transfer of orders to EPEX/EEX via algo trader (exchange API)

- Automatic import and redistribution of closed intraday deals
- Netting and automatic assignment process
- Creating OTC deals

An optimization tool (e.g., BelVis ResOpt) can be connected to determine the optimal use of flexibilities on the markets and transfer the results to the BelVis+ Short Term Cockpit.

Your benefits

- Handling of the entire short-term trading process using a single tool
- High level of automation
- Ease of use: convenient management of trading positions (table, chart), configurable dashboards, etc.
- Direct connection to exchanges
- Flexible interfaces to upstream and downstream systems, notably algo trader solutions
- Deal management and automatic redistribution of positions
- On-premise or SaaS solution from the certified KISTERScloud

Send bid and view result of day-ahead and intraday trading
